**Abstract**

Write a concise summary (150–250 words): context, problem, proposed method, main results, and significance.

**Keywords:** keyword one; keyword two; keyword three; keyword four

## 1 Introduction

Context and motivation. Related work can be cited like this [1]. State the contributions clearly:

- first contribution;
- second contribution;
- third contribution.

The rest of the paper is organized as follows: Section 2 presents the method, Section 3 the results, and Section 5 concludes.

## 2 Problem Formulation and Method

Consider the observation model

$$\boldsymbol{y}_k = \mathbf{H}\,\boldsymbol{x}_k + \boldsymbol{n}_k, \qquad \boldsymbol{n}_k \sim \mathcal{N}(\mathbf{0}, \mathbf{R}), \tag{1}$$

where $\boldsymbol{x}_k \in \mathbb{R}^n$ is the state. The estimate is obtained by

$$\hat{\boldsymbol{x}} = \arg\min_{\boldsymbol{x}} \|\boldsymbol{y} - \mathbf{H}\boldsymbol{x}\|^2_{\mathbf{R}^{-1}}. \tag{2}$$

## 3 Results

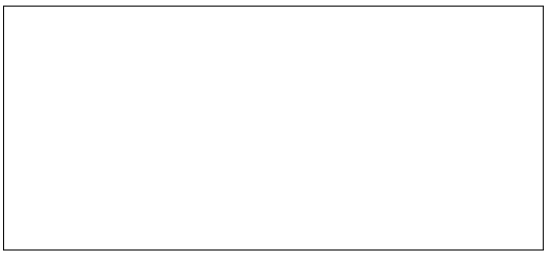

## 4 Discussion

Interpretation of results, limitations, and comparison with prior work.

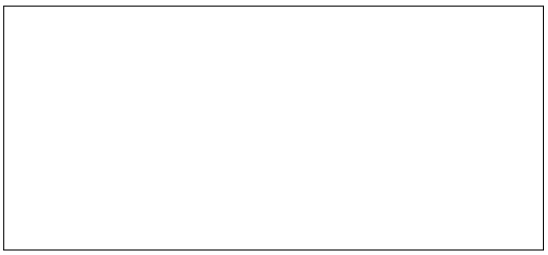

*Corresponding author: email@ensta.fr

**Algorithm 1** Proposed procedure

**Require:** Measurements $\{\boldsymbol{y}_k\}_{k=1}^{K}$
**Ensure:** Estimate $\hat{\boldsymbol{x}}$
Initialize $\hat{\boldsymbol{x}}_0$
**for** $k = 1$ to $K$ **do**
    Update estimate using Equation (1)
**end for**
**return** $\hat{\boldsymbol{x}}_K$

**(a)** First panel.

**(b)** Second panel.

**Figure 1:** Overall caption describing Figures 1a and 1b.

## 5 Conclusion

Summary of contributions and perspectives for future work.

## Acknowledgments

Funding sources and acknowledgments.

## Data Availability

Statement on data and code availability.
